

Problem – Solution Fit Canvas

Food Ordering Behaviour and Consumer Trends

Team ID: SWTID-2026-5277

Project Name: Food Ordering Behaviour and Consumer Trends

Date: 11 July 2026

1. Customer Segment(s) <i>Who is your customer?</i> Rahul Sharma – Business Analyst analysing order & cuisine trends. Priya Mehta – Operations Manager overseeing delivery performance. Neha Reddy – Regular customer ordering food for lunch/dinner.	2. Jobs-to-be-Done / Problems <i>Which jobs/problems do you address?</i> Rahul: Quickly spot order trends, top cuisines and city-wise demand from 50,000+ raw records. Priya: Identify delivery delays and peak-hour workload imbalances across cities. Neha: Get food delivered quickly, at a fair price, with good cuisine variety.	3. Triggers <i>What triggers customers to act?</i> Rahul: Monthly business reviews demanding fresh, data-backed insights. Priya: Rising complaints or visible delays during lunch/dinner rush. Neha: Hunger at peak mealtimes, discounts, or craving a specific cuisine.	4. Emotions: Before / After <i>How do customers feel before & after?</i> Before: Overwhelmed by raw data (Rahul); frustrated by inefficiency (Priya); anxious about slow/unreliable delivery (Neha). After: Confident with clear dashboards (Rahul); in control of operations (Priya); satisfied and loyal when expectations are met (Neha).
6. Customer Constraints <i>What constraints limit their choices?</i> Limited coding/analytics skill among analysts & managers — need a visual, no-code tool. Budget limits for enterprise BI licensing. Large data volume (50,000+ orders) can slow down basic reporting tools. Customers are price-sensitive and have low tolerance for delivery delays.	5. Available Solutions <i>What solutions exist today? Pros & cons?</i> Manual Excel/pivot-table analysis — slow, error-prone, doesn't scale. Generic BI tools lacking food-delivery-specific metrics. Static reports with no interactivity or drill-down. Phone-based coordination with delivery partners — no real-time visibility.	7. Behaviour <i>What do customers do to solve the problem?</i> Rahul: Exports CSVs and builds manual pivot charts before switching tools. Priya: Tracks delays via ad-hoc reports and follow-up calls with delivery partners. Neha: Compares apps/cuisines, checks ratings, and reorders from platforms that satisfied her before.	8. Channels of Behaviour <i>8.1 Online 8.2 Offline</i> 8.1 Online: Tableau dashboards, food delivery apps, in-app ratings & notifications. 8.2 Offline: Team review meetings, printed operational reports, phone coordination with drivers.
9. Problem Root Cause <i>What is the real reason this problem exists?</i> Order data is large and multi-dimensional (city, cuisine, meal type, time, ratings) but scattered across raw CSV records with no structured analytics layer — so patterns like peak-hour delays or under-performing cuisines stay invisible, leading to inconsistent decisions.			
10. Your Solution <i>The proposed solution</i> A Tableau-powered interactive analytics solution that ingests raw order data (.csv), processes it through Tableau's Hyper engine, maps city/location via the OpenStreetMap API, and publishes role-specific dashboards — helping Business Analysts track trends, Operations Managers optimise delivery performance, and ultimately giving Customers a faster, more reliable experience.
