

Project Design Phase

Proposed Solution Template

Date	11 July 2026
Team ID	SWTID-2026-5277
Project Name	Food Ordering Behaviour and Consumer Trends
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template, drawing on the food ordering behaviour dataset and the three usage scenarios (Rahul Sharma – Business Analyst, Priya Mehta – Operations Manager, Neha Reddy – Customer).

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The food delivery industry generates large volumes of order data (city, cuisine, meal type, order value, delivery fee, delivery time, ratings) but businesses struggle to convert this raw data into actionable insight. Business Analysts (Rahul) cannot easily spot order/cuisine trends; Operations Managers (Priya) cannot easily identify delivery delays and peak-hour workload imbalances; and Customers (Neha) experience inconsistent delivery speed, pricing and service quality as a result. There is no single, structured, easy-to-use analytical view that connects these needs.
2.	Idea / Solution description	Build an interactive Tableau-based analytics solution that ingests the raw order dataset (order_id, city, cuisine, meal_type, order_value, delivery_fee, time_taken_to_order, rating_given, is_repeat_order, etc.), processes it through Tableau's Hyper data engine, and publishes role-specific dashboards to Tableau Cloud. Business Analysts get trend and cuisine-performance views; Operations Managers get delivery-time and peak-hour workload views; and the resulting operational improvements translate into a faster, more satisfying ordering experience for customers.
3.	Novelty / Uniqueness	Unlike generic BI reports, the dashboard is purpose-built around three real stakeholder journeys (Analyst, Operations Manager, Customer) rather than one generic view, so each user sees only the metrics relevant to their job. It combines behavioural fields rarely used together in food-delivery analytics — mood, hunger level, company (dining companions) and rainy-weather — with operational fields (delivery fee, time taken, repeat orders) to reveal patterns a purely operational or purely marketing dashboard would miss, and uses the OpenStreetMap API for lightweight, no-cost city/location mapping instead of a paid GIS layer.

S.No.	Parameter	Description
4.	Social Impact / Customer Satisfaction	Faster identification of delivery delays and peak-hour bottlenecks means customers like Neha experience more reliable, on-time delivery, which is the single biggest driver of her satisfaction and reorder behaviour in the dataset. Better visibility into cuisine and pricing patterns also helps the business offer fairer, more relevant options across cities, supporting local restaurant partners and reducing food wastage from mismatched demand forecasting.
5.	Business Model (Revenue Model)	The solution supports the platform's existing revenue streams — delivery fees, commission on order value, and premium/priority delivery options — by helping identify which cities, cuisines and meal times generate the highest order value and repeat-order rate, so marketing spend and delivery resources can be directed toward the highest-return segments. The dashboard itself can also be offered as a value-added analytics module to restaurant partners for a subscription fee.
6.	Scalability of the Solution	Because the pipeline uses Tableau's columnar .hyper extract format, it can scale from the current 50,000+ order records to several million rows without a redesign. New cities, cuisines or meal types are automatically picked up by the existing data model, and the same dashboards can be extended to new stakeholder roles (e.g. Marketing, Restaurant Partners) simply by publishing additional views on top of the same underlying data source.
