Entice

How does the customer become aware they want to order?

Enter

What happens as they begin the ordering process?

Engage

In the core moments of ordering & paying, what happens?

Exit

What happens as the order is received and reviewed?

Extend

What happens after the meal is delivered?

Steps

What does the customer typically experience?

Interactions

Touchpoints: people, places, digital screens

Goals & Motivations

"Help me..." at each step

Positive Moments

Enjoyable, exciting steps

Negative Moments

Frustrating, confusing steps

Areas of Opportunity

How might we improve each step?

Craving strikes Feels hungry, stressed, or in the mood to celebrate and thinks about ordering in.	Opens the app Habit or a notification pulls them back into the food delivery app.	Sets city & context Confirms location; browsing happens on a weekday or weekend, any time of day.	Filters cuisine & tier Chooses cuisine (e.g. Biryani, Chinese, Desserts) and Budget/Mid-range/Premium tier.	Builds the cart Picks a meal type (Breakfast/Lunch/Snacks/Dinner) and adds items.	Applies a discount Checks for and applies a coupon code before checkout.	Pays for the order Enters payment details; sees delivery fee added to the total.	Order confirmed Gets confirmation that the restaurant has accepted and started preparing the order.	Waits & tracks Watches order status, especially anxious if it is raining outside.	Receives the order Food arrives — often shared with a partner, friends, family, or eaten alone.	Rates the order Leaves a star rating reflecting the overall experience.	Decides on reorder Chooses whether to reorder the same favourites or explore something new.
Mood/hunger prompt at home, work, or on the go; no app screen yet.	App home screen / push notification on their phone.	Location picker and weekday/weekend browsing view.	Cuisine & restaurant-type filter chips, listing page with price tags.	Restaurant menu page, meal-type tabs, live cart icon.	Promo-code field and applied-discount banner in the cart.	Payment gateway screen showing item total + delivery fee.	In-app order-status card and SMS/email confirmation.	Live tracking map, rider location, ETA updates.	Delivery partner at the door; packaging and receipt handed over.	In-app star-rating pop-up shown right after delivery.	Personalised offers banner, "reorder favourites" button, push reminders.
Help me satisfy this craving without much effort.	Help me get back into ordering quickly.	Help me see options relevant to where and when I am.	Help me find a cuisine and price tier that fits my mood and budget.	Help me build a meal I'll actually enjoy.	Help me save money if a discount is available.	Help me pay quickly, safely, with no surprise costs.	Help me feel confident my order is really being made.	Help me know exactly when my food will arrive.	Help me get my food fresh, hot, and on time.	Help me give quick, honest feedback.	Help me discover what to try next time.
The anticipation of a favourite meal feels exciting.	Familiar app layout makes returning effortless.	Orders are spread almost evenly across weekdays and weekends (~50/50) — the app works well any day.	Six cuisines and three price tiers mean there is something for every budget — Premium is the single most-ordered tier.	Rich menu photos and descriptions make choosing fun, not tedious.	Roughly half of all orders (50%) receive a discount, which feels rewarding.	Checkout is quick — customers spend only about 7.5 minutes deciding before paying.	Instant confirmation removes uncertainty right after paying.	Live tracking makes the wait feel shorter and more transparent.	Most orders are shared with a partner — the single most common company type — making delivery a social moment.	Engaged customers do take a moment to rate, giving the business real signal.	Nearly half of customers (about 50%) are repeat orderers, showing real loyalty potential.
"Stressed" is the single most common mood behind an order — cravings driven by stress can lead to regretted choices.	No proactive nudge exists to catch the customer at the exact right craving moment.	No default location memory — customers re-enter city/context every time.	Budget vs. Mid-range vs. Premium labels can feel unclear or overlapping.	Deciding what to eat takes real effort — about 7.5 minutes on average, which can feel like decision fatigue.	Discount codes are not always obvious or guaranteed to apply, causing confusion at checkout.	The delivery fee (around ₹60 on average) can feel like a frustrating, hidden add-on.	Customers have no visibility into actual kitchen prep time.	There is no reliable delivery-time data captured — ETA accuracy is a guess, and rainy-weather orders (~50% of all orders) add extra delay risk.	Evening is the single busiest ordering window, which can strain delivery capacity and slow arrivals.	Average rating is only 2.99 out of 5 — most orders leave customers merely lukewarm, not delighted.	With only about half of customers reordering, loyalty is fragile and churn risk is real.
Use mood & hunger-level signals to trigger a well-timed "craving" nudge.	Could we send a smarter re-engagement notification based on past order timing?	Auto-detect and remember city/location to remove a manual step.	Simplify tier labels with clear price ranges instead of Budget/Mid/Premium wording.	Add a "reorder your favourite" shortcut to cut decision time below 7.5 minutes.	Show discount eligibility clearly upfront, before the customer reaches checkout.	Make the delivery fee visible earlier and explain what it covers.	Send a proactive prep-time estimate based on restaurant type.	Start capturing true delivery-time data (not just decision time) to power reliable, weather-adjusted ETAs — a top ask from the Operations Manager persona.	Add dynamic staffing/delivery buffers for Evening peak hours and rainy days.	Investigate root causes behind the low 2.99/5 average rating — a key priority for the Business Analyst persona.	Launch a loyalty/rewards programme to turn one-time customers into repeat customers.
