

Project Performance Test

Date	14 July 2026
Team ID	SWTID-2026-5277
Project Name	Food Ordering Behaviour and Consumer Trends
Maximum Marks	4 Marks

Model Performance Testing:

Project team shall fill the following information in the model performance testing template. This version additionally embeds screenshot evidence captured from the published Tableau dashboard for each parameter below.

S.N O.	Parameter	Screenshot / Values
1	Data Rendered	food_ordering_behavior_dataset.csv connected to Tableau Desktop via Text File data source. 50,000 records rendered across 19 fields with 0 null values in any column. Tableau auto-classified 13 fields as Dimensions (City, Cuisine, Meal Type, Order Time, Day Type, Restaurant Type, Mood, Hunger Level, Company, Discount Applied, Is Repeat Order, Rainy Weather, User ID) and 6 as Measures (Order Value, Delivery Fee, Time Taken to Order, Rating Given, Age, Order ID). Row-count in the Data Source pane (50,000) matched the source CSV exactly, confirming a clean, lossless render. The Key Performance Matrix (Fig. 1) confirms these top-line figures: 50,000 Total Orders, Rs. 30.37M Total Transaction Amount, Avg. Rating Given of 3, and an Avg. Time Taken to Order of 7.50 minutes.
2	Data Preprocessing	Fields renamed for readability (order_value → Order Value (Rs.), time_taken_to_order → Prep Time (mins), rating_given → Rating). Discount Applied, Is Repeat Order and Rainy Weather (Yes/No) converted to Boolean flags for cleaner calculations. An Age Group bin (18-25, 26-35, 36-45, 46+) was created from the Age field. Duplicate-check confirmed all 50,000 Order IDs are unique with no blank or malformed rows. Data types (String, Integer) verified against the CSV schema before publishing the extract.
3	Utilization of Filters	Quick Filters applied on City (6 values), Cuisine (6 values), Meal Type (Breakfast/Lunch/Dinner/Snacks), Day Type (Weekday/Weekend) and Order Time (Morning/Afternoon/Evening/Night). A Context Filter was set on City to speed up calculations on the large 50,000-row extract. A Parameter-based filter lets users set a minimum Rating Given threshold. Filter Actions link the City map to the detail views so a click on a city updates every chart in the dashboard — demonstrated by the Cities By Order Volume treemap (Fig. 9) and the Flavors Across Cities heatmap (Fig. 2).
4	Calculation fields	Used Total Order Revenue = [Order Value] + [Delivery Fee]; Repeat Order Rate = SUM(IF [is_repeat_order]='Yes' THEN 1 END) / COUNT([order_id]); Avg Prep Time (mins) = AVG([time_taken_to_order]); Discount Impact = AVG(IF [discount_applied]='Yes' THEN [order_value] END) – AVG(IF [discount_applied]='No' THEN [order_value] END); Age Group bucket calculation; Rainy-Day Order Flag = IF [rainy_weather]='Yes' THEN 'Rainy' ELSE 'Clear' END. These calculations power the Revenue Contribution by Meal Type donut (Fig. 8) and the Orders Distribution by Age Group & Restaurant Segment chart (Fig. 3).

S.N o.	Parameter	Screenshot / Values
5	Dashboard design	No. of Visualizations / Graphs published — 9: (1) Key Performance Matrix — 50,000 Total Orders, Rs. 30.37M Total Transaction Amount, Avg. Rating 3, Avg. Time Taken to Order 7.50 min; (2) Flavors Across Cities heatmap — cuisine-wise order value by city, ranging Rs. 719.81K (Bangalore, South Indian) to Rs. 813.99K (Mumbai, Desserts); (3) Orders Distribution by Age Group & Restaurant Segment — Millennial and Gen Z each contribute roughly 10M orders across Budget/Mid-range/Premium segments, versus ~4.1M for Adults and ~3.1M for Children; (4) Distribution of Customer Preference Across Cuisines — near-even split, Desserts leading at 16.90% and North Indian lowest at 16.46%; (5) Order Distribution Across Company Type & Meal Type — Alone/Family/Friends/Partner each contribute an even ~3.0K–3.23K orders per meal type; (6) Distribution of Delivery Time Across Orders — histogram showing a broadly even spread of prep-time bins; (7) Customer Rating Analysis by Meal Type — Breakfast, Lunch, Dinner and Snacks all receive comparable average ratings; (8) Revenue Contribution By Meal Type donut — Breakfast 25.29%, Lunch 25.03%, Dinner 24.63%, Snacks 25.05%; (9) Cities By Order Volume treemap — Mumbai highest at 8,443 orders, Hyderabad lowest at 8,262. All nine visualizations are combined into one interactive dashboard with tooltips, highlight actions and the filter set described above. Screenshot evidence for each is included in the Dashboard Screenshots section below.
6	Story Design	No. of Visualizations / Graphs — 3 story points built on the dashboard above, one per persona: (1) Rahul Sharma – Business Analyst: order trends, cuisine performance and city-wise demand; (2) Priya Mehta – Operations Manager: delivery/prep-time distribution and peak-hour workload across cities; (3) Neha Reddy – Customer: satisfaction drivers such as timely delivery, pricing and cuisine variety. Each point uses caption text, navigate buttons and highlight actions tied to the underlying dashboard and the visualizations captured in Figs. 1–9.

Dashboard Screenshots (Evidence)

The following screenshots, exported from the published Tableau dashboard, provide visual evidence for the values and visualizations summarised in Parameter 5 (Dashboard design) above.

Key Performance Matrix			
Total Orders	Total Transaction Amount	Avg. Rating Given	Avg. Time Taken To Order
50,000	30.37M	3	7.50Min.
